Desired and expected behaviour

Synthetic biology

Systems biology

Adapted from C.P. Barnes[†], D. Silk[†] & M.P.H Stumpf. Bayesian design strategies for synthetic biology. Interface focus. (2011)

Motivation - Systems biology

- Oscillating expression of Hes1 plays a central role in regulating vertebrate embryo segmentation.

Motivation - Systems biology

- Traditional qualitative approaches can fail when fitting to complex behaviour.

Motivation - Synthetic biology

- What structures and parameter combinations give rise to desired types of behaviour?
- In particular, can we design and build a biological circuit that exhibits chaos?

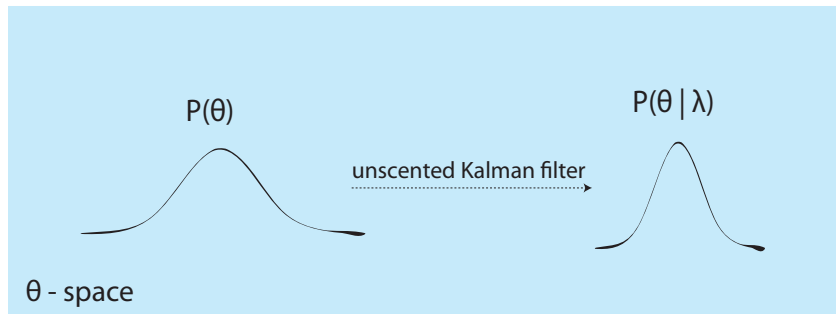

Encoding the desired behaviour

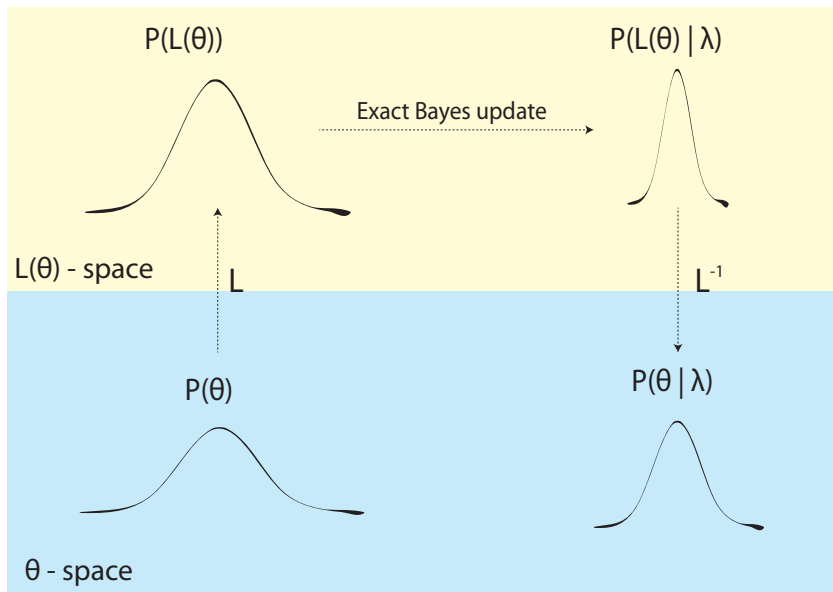

- Lyapunov exponents, $\{\lambda_i\}$ encode the qualitative behaviour of the model.

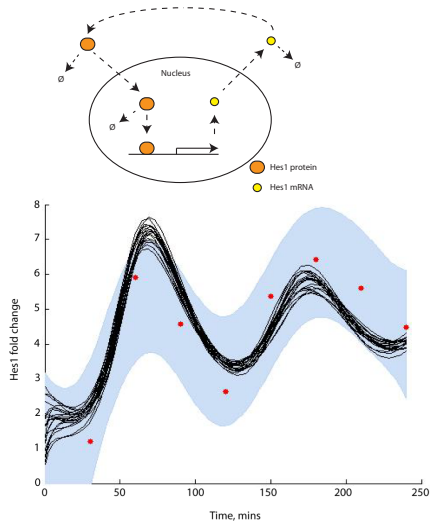

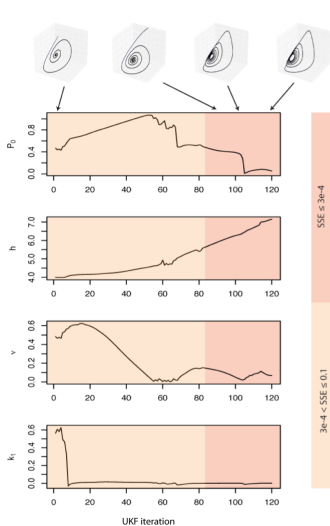

The unscented Kalman filter for qualitative inference

The unscented Kalman filter for qualitative inference

Oscillations in a Hes1 regulatory model

Silk, D. et al. Designing attractive models via automated identification of chaotic and oscillatory dynamical regimes. Nat. Commun. (2011).

Controlling Chaos

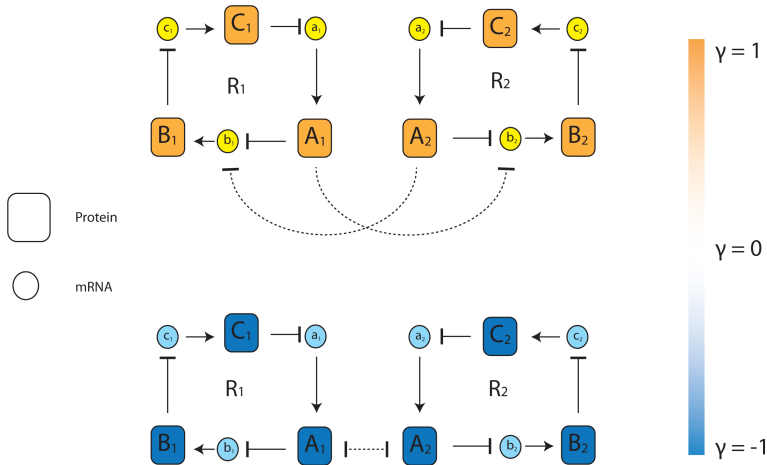

Oscillations Chaos

Silk, D. et al. Designing attractive models via automated identification of chaotic and oscillatory dynamical regimes. Nat. Commun. (2011).

Chaos in coupled repressilators

Regions of chaos

Chaotic behaviour

- The smallest perturbation leads to decoupling of repressilator trajectories.
